

Why Bidirectional Tractors?

Antonio Carraro TRX-8400 (68HP)

Because they increase productivity.

A widening range of agricultural tractors from 23 HP to 83 HP offer the benefits of placing implements immediately in front of driver allowing excellent visibility and precision control. Forklifts, bucket loaders, cranes, brush mowers, hay mowers, grain swathers and specialized in-row cultivators for orchards and vineyards all work best when placed in front of the operator. Closer faster work, fewer errors and less fatigue are the rewards.

When plowing, discing, seeding, baling, spraying or manure spreading are the tasks, the driver module rotates 180 degrees and tractor operates in conventional orientation. Either way these tractors have a lower center of gravity giving better stability on steep ground, higher traction and better weight distribution because all four drive wheels are equal in size and carry an equal share of the load. All these efficiencies allow tractor to be lighter and more fuel efficient.

Give Ferrari tractor CIE a call at (530) 846-6401 or FAX (530) 846-0390 for details on a model to fit your application. We have supplied this technology since 1990.
