Extraordinary Seeder Versatility

This 3pt. mounted planting module can be configured to plant row crops 2 or 3 rows at a time accurately and with precision control of plant spacing in the row. A plate type seed meter singulates corn or beans or etc. and gear driven mechanism receives power from units ground wheels to control inrow spacing of seed. Achieving far greater accuracy than you get from other seeders short of a vacuum seeder for about \$6,000. Integral fertilizer box with its own gear driven meter is a bonus.

These modules are very solid and intended for serious work, the 15" front disc cuts trash, followed by double disc opener to place seed and rear covering wheel. A typical 3 row setup weighs almost 1600 lbs yet takes just a 35 HP tractor to operate well.

The same module can be setup with 7 rows of double disc openers each with depth limiting rings to give accurate seed placement for pasture renovation or cover crop planting, a fertilizer box and two seed boxes to handle both small seed and larger seeds used in cover cropping. Just over 4 feet wide, it can work in narrow vineyard and berry rows, on terraces, on contours, stream banks and to plant trap crops. At 1200 plus pounds, it will work difficult soils with just 35 HP again for about \$6,000.
